

“What the interface for managing a contact's roles might look like and list the steps you would take to implement that feature.” By Minh Le

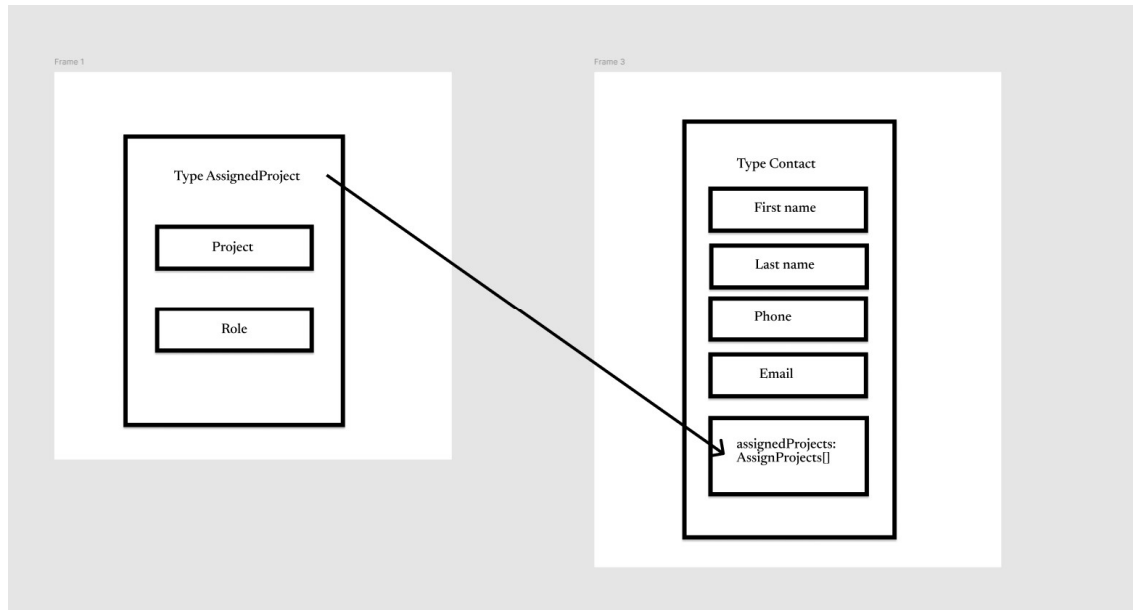

1. Creating a new Type ‘AssignedProject’ that requires project and role attributes.

Since each Contact can be assigned to one or more Project, and each Contact can be assigned a role to a Project, we can create an AssignedProject type that has both Project and Role attributes. This means we can allocate an individual role to a Project.

2. Adding Type 'AssignedProject[]' to Type 'Contact'

Because each Contact can be allocated to a Project with their role, we can add 'assignedProjects' with the AssignedProject[] Type to Type 'Contact'. This means each Contact can be allocated to a Project and the Contact can have a different role on each Project. assignedProjects is an array since Contact can be assigned to multiple projects.

3. Steps in how I would implement this

I would add an AssignedProject type in contact.model.ts and modify the Contact type to include assignProjects as type AssignProject[].

Consequently, I would have to modify components such as the contact-(edit/add)-dialog component files and contact-details component files to adapt with the changes.

For example, in the contact-details.component.html, I can add ngFor to loop over the assignProjects array of the Contact, grab the assigned Projects and the Roles that the Contact are assigned for the Projects and display it.

Assigned Project:

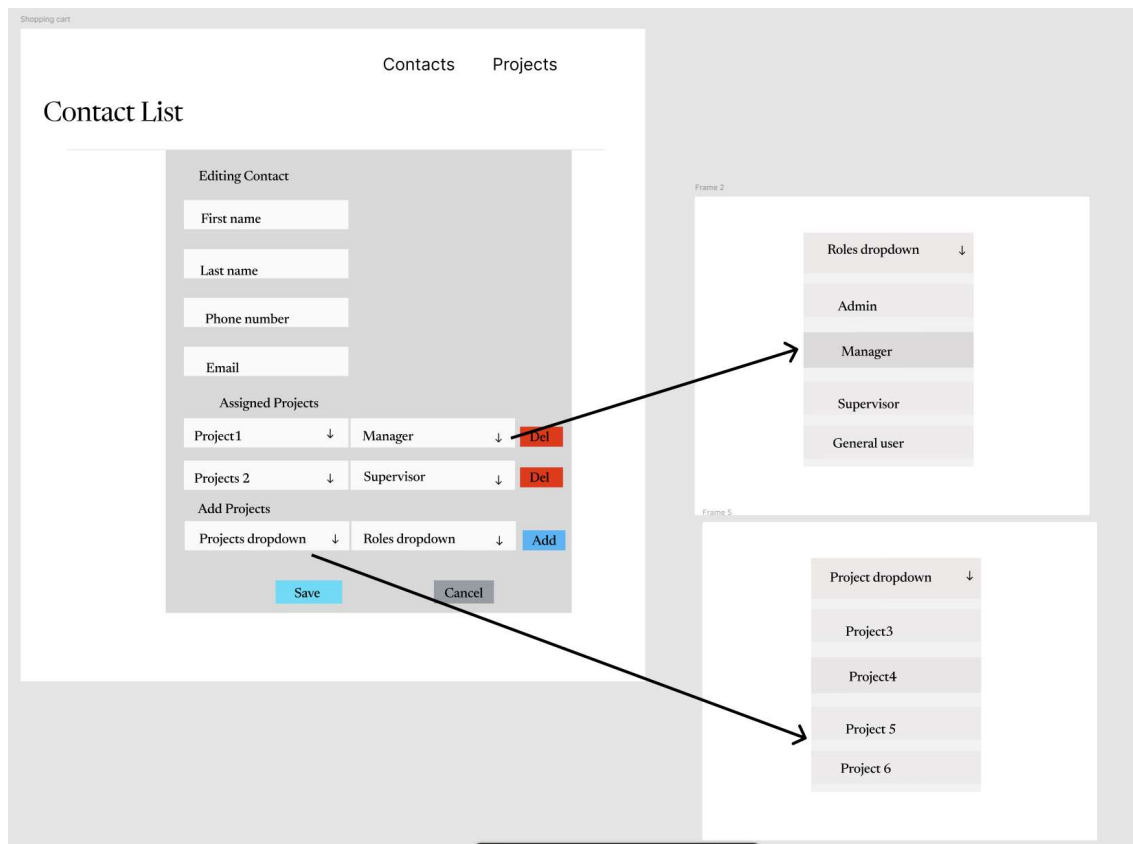

Project: Ginger beers

Role: Manager

Project: Pepsi

Role: Supervisor

In contact-edit-dialog component, I would add existing Project – Role assignments of the Contact (using ngFor) to the Dialog as a dropdown. This will make it easier to edit the Projects and assigned role of the Contact.

Assigned Projects

We can have a current state of the Contact and update the Contact when saved or discard the changes when cancelled. Selecting a dropdown from already Assigned Projects will update the state of the Contact, and pressing the delete button will remove the assigned Project/Role from the current Contact State.

Add Projects

The add button will add a Project with the role to the Contact and will update the Assigned Projects during Editing Contact Dialog. You can also have a condition included with ngFor the Projects dropdown on add Projects to not include Projects that are already added to the Contact.

For example like the diagram above: While editing Bob's Contact, He already has Project 1 and 2 assigned to him. This means the Project dropdown in Add Projects will not show 'Project1' nor 'Project2'.

The button clicks methods will be in contact-edit-dialog.component.ts such as onAddAssignedProject() that updates the currentState of the Contact (but not modifies the Contact until the save button is pressed).

4. What to do in the future

We would also want to check Projects and Contacts assigned to the Project.

We can create a page with new components that displays Projects. Clicking on the Project will redirect to a new page and show the descriptions about the Project as well as the Contacts assigned to the Project and their Role displayed.
